

1. React Router (for navigation)

If you're building multi-page apps, you'll need a routing library to handle different routes and navigation within your app.

- Install:

```
bash  
  
npm install react-router-dom
```

 Copy code

- React Router is the standard choice for routing in React apps. You'll use components like `<BrowserRouter>`, `<Route>`, and `<Link>` to manage navigation and page routing.

2. Redux (for state management)

Redux is a popular state management library, though with the introduction of React's Context API and hooks, some developers use those instead. Redux is still helpful for large-scale applications with complex state logic.

- Install:

```
bash  
  
npm install redux react-redux
```

 Copy code

- If you want something more modern, you can try **Redux Toolkit**, which simplifies Redux setup:

Get smarter responses, upload files and images, and more.
